# Understanding healthcare workers' confidence in AI

# AI confidence in healthcare: A framework

# Governance: The foundation of AI confidence

## Governance: Actions for confidence in AI

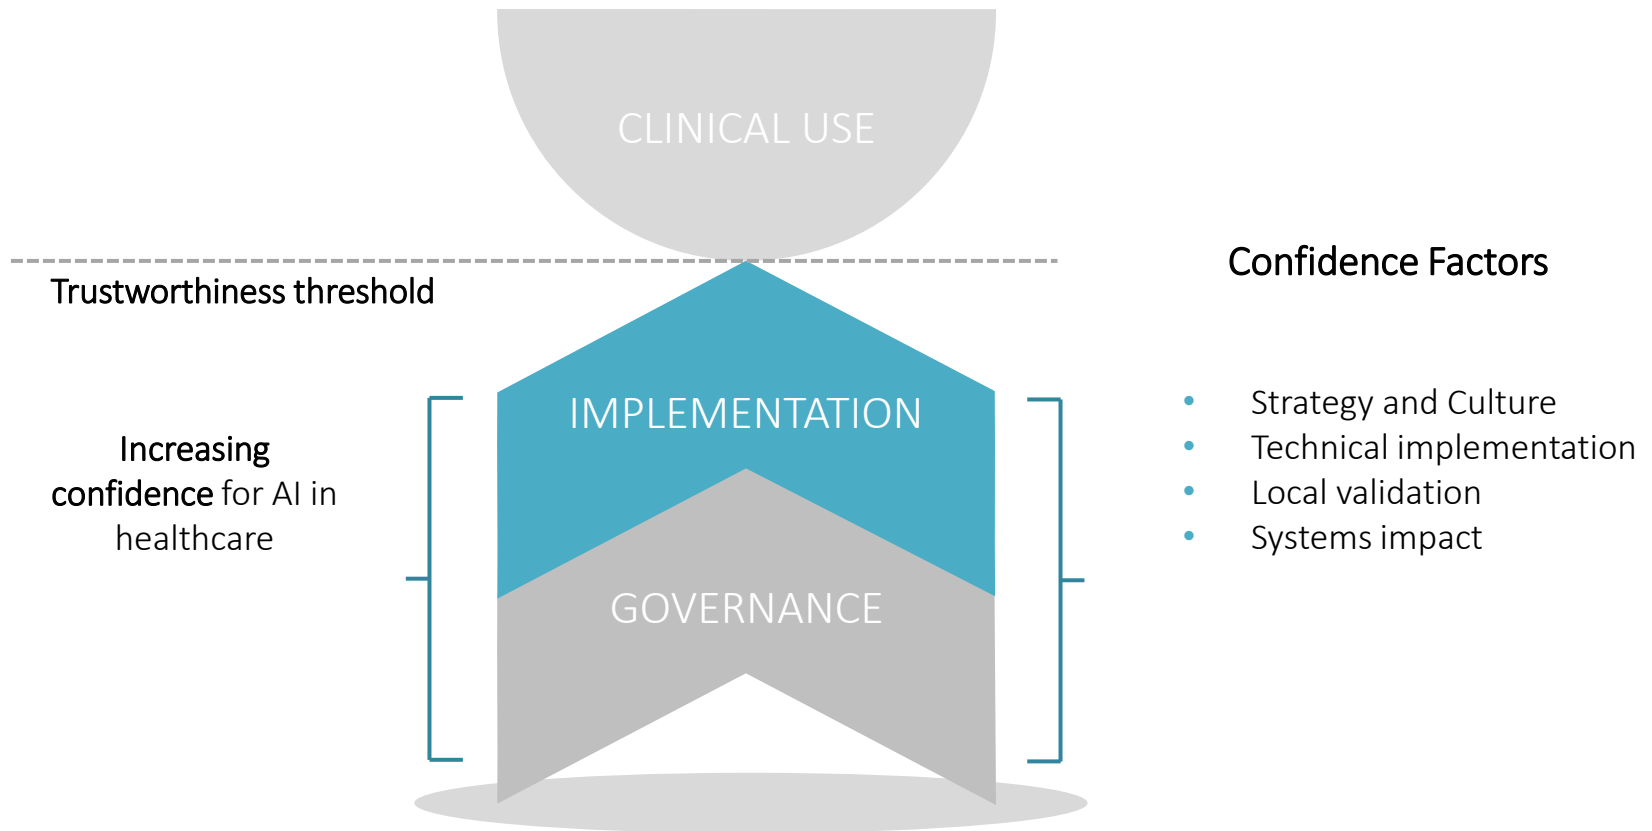

- Develop [professional guidelines](#) on creating, implementing and using AI for all clinical staff groups
- Continue development of [regulatory frameworks for AI](#) performance, quality and risk management
- Finalise formal [requirements for evidence and validation](#) of AI technologies
- Develop [further guidance on liability](#) for AI (including autonomous AI)

## Governance: Actions (cont.)

- Establish flexible and **dynamic process for developing clinical guidelines** on AI-assisted clinical tasks and technologies
- Develop clear **oversight and governance pathways** for AI, including AI not classified as a medical device
- Develop **standards for developing AI for health and care settings** (including co-creation with users, model transparency and mitigation of model bias)
- Conduct further **research to understand how certain AI model features influence confidence**

# Implementation: Building AI confidence

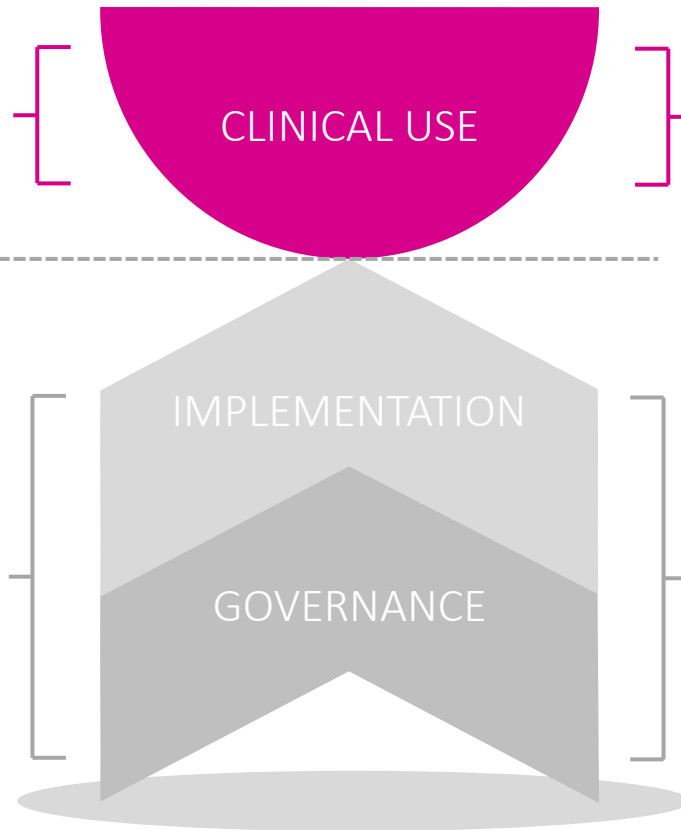

## Implementation: Actions for confidence in AI

- Develop further [advice, guidelines and prototypes for information technology and governance](#)
- Develop strategies and assign resources to encourage [cultures that support innovation and robust appraisal of AI](#)
- Collaboration and [sharing of knowledge across NHS sites](#) adopting AI technologies
- Develop and resource [multi-disciplinary AI teams](#) across clinical, technical, and administrative roles.
- Establish [pathways for ongoing monitoring](#), performance feedback and safety event reporting involving AI technologies

# Clinical Use: Assessing appropriate AI confidence

Assessing appropriate confidence in AI for a specific clinical decision

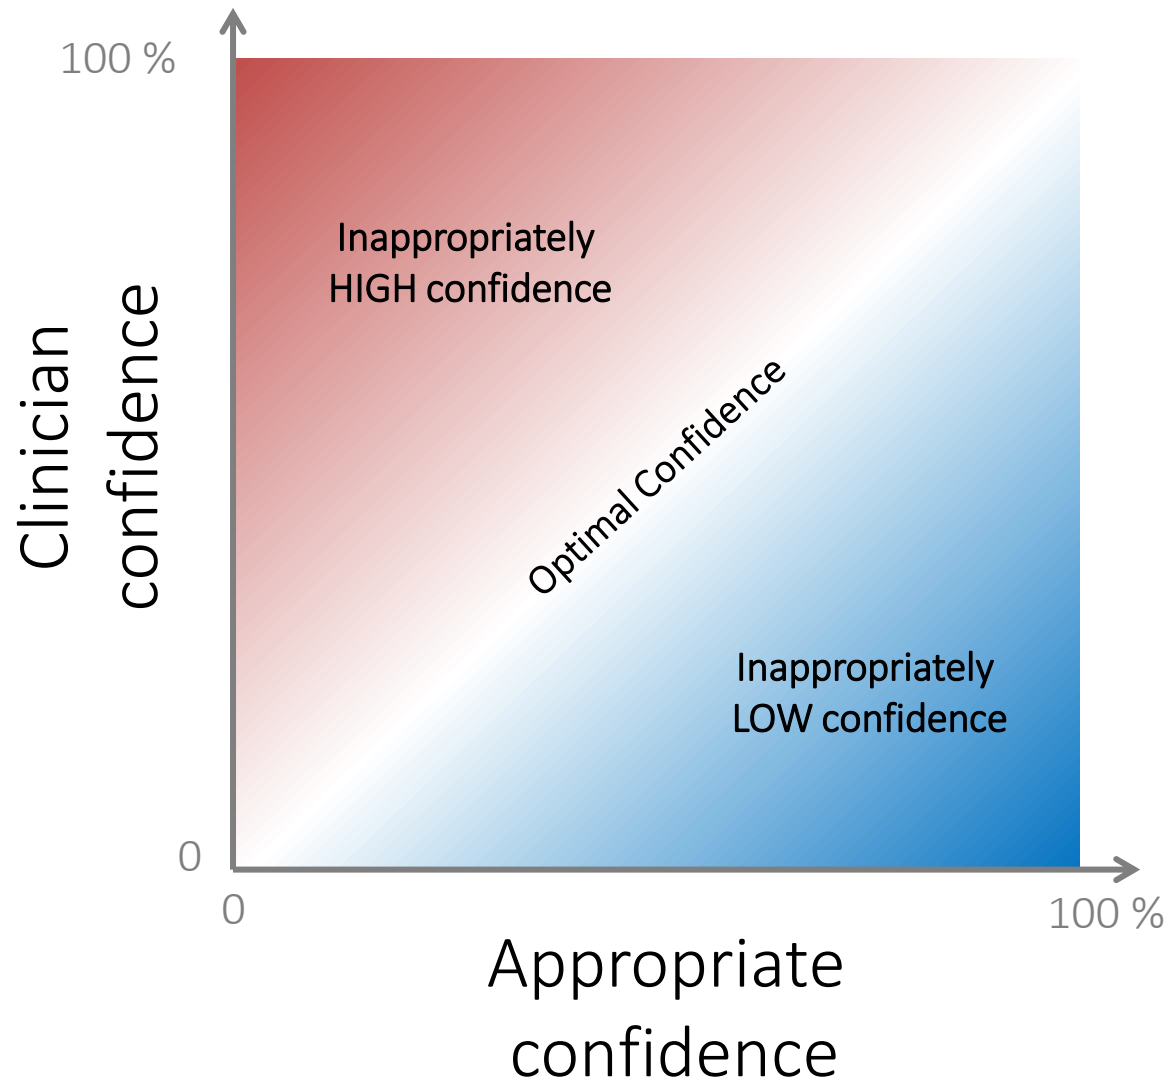

## Confidence Factors

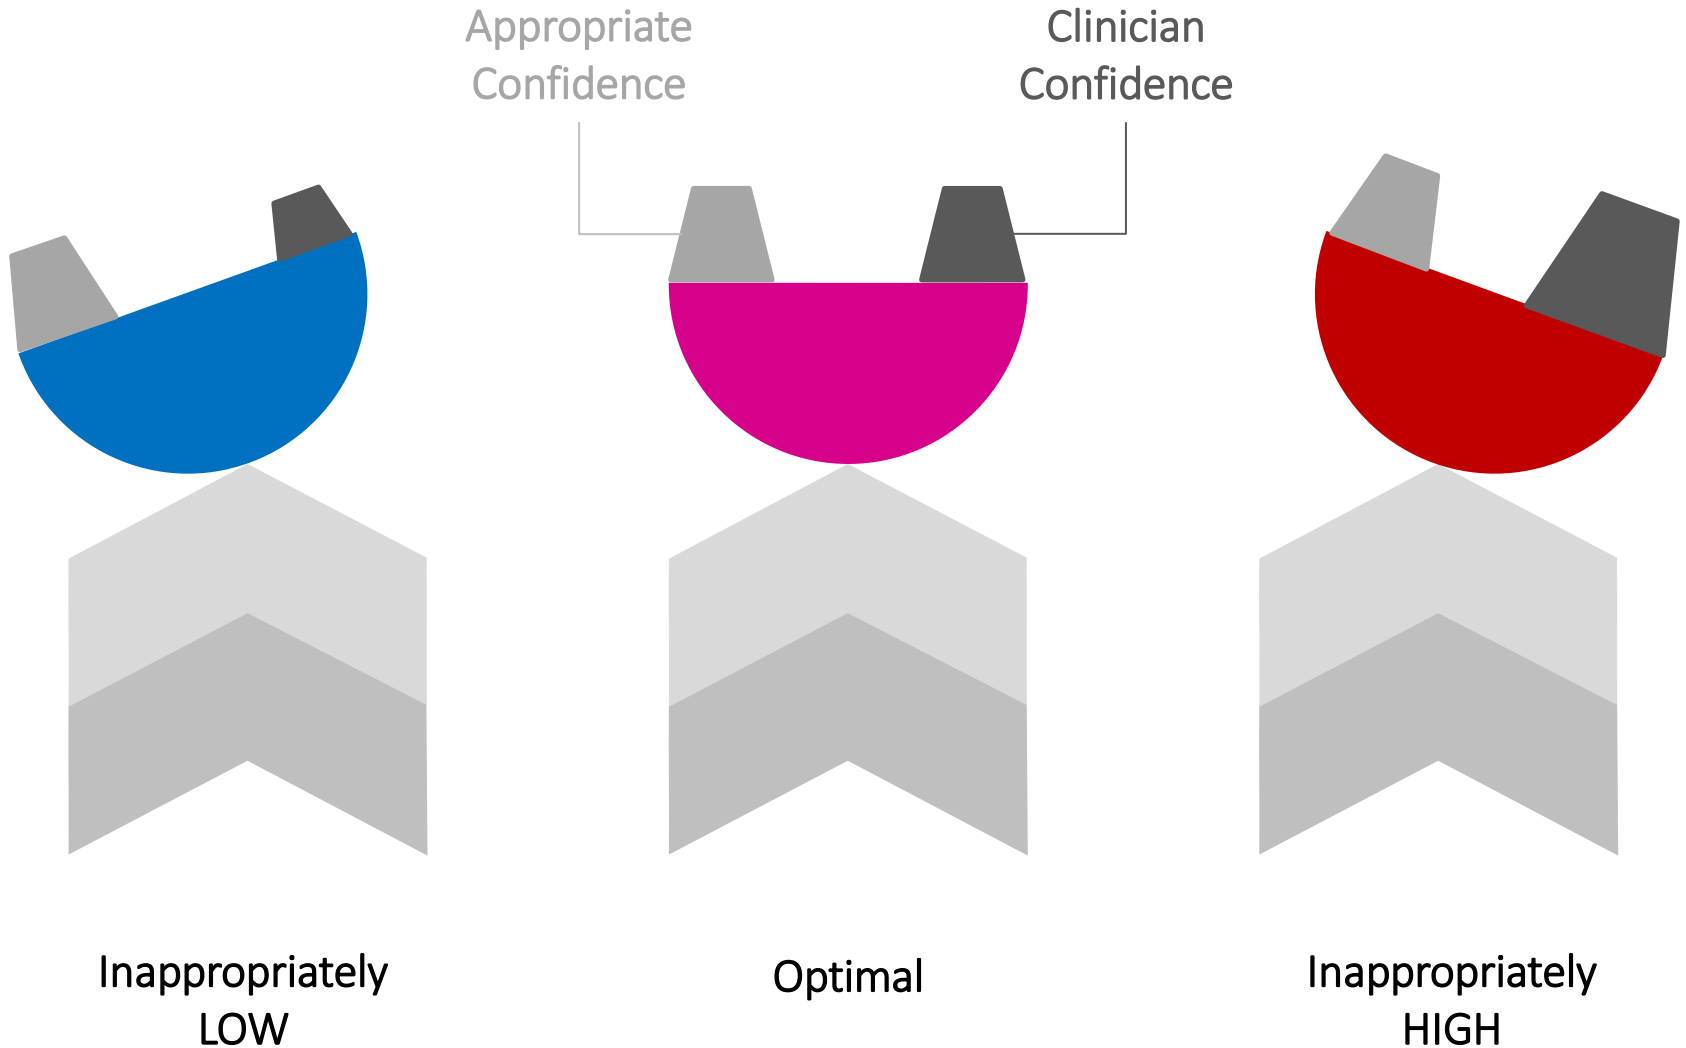

- Clinician attitudes
- Clinical context
- AI model design
- Workflow integration
- Cognitive biases

# Clinical Use: Appropriate and optimal confidence

# Clinical Use: Confidence in AI-derived information

## Clinical Use: Actions for confidence in AI

- Develop internal systems to record AI-assisted CRDM, including how AI has influenced or changed the decision
- Conduct further research on explainable AI and its safe use in clinical reasoning and decision making (CRDM)
- Conduct further research to understand and optimise presentation of AI-derived information for CRDM
- Develop confidence in AI technologies via patient engagement and education activities
- Enable clinicians to determine appropriate confidence in AI-derived information and balance it with conventional clinical information for CRDM
